introduction and welcome

Welcome to the sixth and final edition of the Maize Hybrid Performance Trials results booklet. For the 2019/20 season we continued with eight trial sites, with one of the maize seed companies in the programme hosting, managing and harvesting MPT trials. Unfortunately, due to the COVID-19 Level 4 lockdown from we were unable to undertake the silage harvest at the Waikato Ruakura, Waikato Peat, Manawatu Opiki and Canterbury Kimihia sites.

This is the third edition to include results from multiple sites and multiple years. This means that some hybrid results are given as averages from six different seasons, and from up to nineteen separate trials. Data from multiple seasons for a maize hybrid's performance is more valuable than results from a single season, as they show the hybrid's ability to perform over seasons with different weather patterns. Ultimately the most consistent performers will rise to the top of

MESSAGE FROM FAR CEO

At the end of 2019, FAR conducted both an on-line survey and a phone survey of maize growers, seeking their feedback on FAR's involvement in the Maize Hybrid Performance trial programme (MPT). We decided to do this because we had been getting feedback from ARG groups and individual growers questioning the value of the MPT programme and whether FAR's investment could be better allocated to other maize research activities.

We received approximately 180 responses to the survey, which were split almost equally in favour of and against ongoing involvement in the MPT. Some of the commentary included with growers' responses suggested that many wanted to retain the MPT programme to "keep the seed companies honest" rather than because they used the information to inform hybrid selection.

The FAR board did not think that this was a good enough justification to warrant our continued investment. They also had reservations about the

multiple year results. The more trials a cultivar has been in, the more confidence can be taken from its reported performance.

The MPT system relies on companies collaborating and including their cultivars for the overall good of the industry. We encourage you to use the information in this booklet to help you make sound hybrid selection decisions.

Also, it is important to be aware that the yields obtained in the MPT trials, and other maize hybrid trials are higher than will be achieved in commercial crops.

David Green
President
New Zealand Plant Breeders Association

July 2020

lack of involvement of one of the major industry players and the robustness of the programme given the relatively small number of trials. As a result, in March, the FAR board approved the organisation's withdrawal from the MPT programme effective 30 June 2020. Members of the MPT governance and technical groups and the remaining members are currently deciding what the future role and format of the MPT programme will be.

FAR recognises that this will be disappointing to some maize growers, but rest assured that we did not take this decision lightly. We genuinely believe that FAR can provide greater benefit to maize growers by allocating our resources to other activities such as environmental and farm systems research. In the 2020/21 year we will recruit a senior maize researcher and develop a maize research strategy to inform the direction of our future maize research portfolio.

Alison Stewart, CEO, FAR

guiding principles

MPT GUIDING PRINCIPLES

The purpose of the MPT programme is to:

- Provide objective measurement of the agronomic and quality performance of commercial maize hybrids available to the New Zealand arable industry across appropriate production regions.
- Foster industry adoption of proven hybrids to maximise industry efficiency and profitability.

The Maize Performance Trials (MPT) are organised and funded through the Maize Hybrid Performance Trial Committee with representatives from the FAR, NZ Plant Breeding & Research Association (NZPBRA), independent researchers and the participating seed companies. Secretarial services were provided by NZPBRA.

METHODOLOGY

The MPT comprises a single stage of hybrid testing and is administered through a single management committee. The committee recognises the purpose of the hybrid testing, and will not compromise the stakeholder requirements of the programme.

The trial programme focuses on the agronomic and quality characteristics of close-to-market pre-commercial and commercial maize hybrids. It is not intended to provide extra evaluation data for commercialisation decisions; the seed companies must make these decisions independently, before the hybrids are entered into the MPT programme. The trial programme evaluates silage and grain hybrids.

Harvest assessments are made at an agreed maturity value for the individual hybrids entered into the programme. These maturity values are determined on a year-by-year basis by the Committee and an agreed harvest schedule is developed at the start of the season.

At each trial site, plots consist of four rows, approximately 5 metres long, planted at 76 cm spacing. Each hybrid is replicated four times within a randomized complete block design. All

data is collected from the middle two rows of the plot. Participating companies supply relative maturity data for placement in trials. The plots are planted from pre-counted packets of seed using an air plot planter and harvested by hand.

The maize seed is provided directly by the seed companies. While the individual seed treatments used by each company may vary, all were commercially available at time of planting, and contained at least an insecticide and a fungicide.

In-season trial assessments included plant count, lodging and disease score; and harvest assessments included an assessment of ear rots, bird damage and yield. At silage harvest, a sample was taken from each plot to determine dry matter content. For grain hybrids, grain moisture and test weights were measured using a Dickey John GAC 2100 Agri moisture meter.

All information published by any party from the MPT programme must be clearly acknowledged as MPT data. The following statement must accompany any such publication.

This information has been generated by the Maize Performance Trial (MPT) operating procedures.

MPT represents the collaboration of the Foundation for Arable Research, the New Zealand Plant Breeding & Research Association and individual seed companies.

CHECK HYBRIDS

Up to five industry standard hybrids may be included in each MPT trial. These are required to provide data linkages among trials, and across multiple seasons. The expected life of the standard entries is around 5 years, and after that they are changed out for newer hybrids gradually, reflecting their stable performance, popularity, and their continued commercial availability, while providing a baseline of performance against which genetic gain can be judged. The standard hybrids used in the trials reported here are:

The multi-year adjusted mean is the most important result in the MPT Results Booklet. This is the third year we have presented multi-year, multi-site data. This was a big step forward for the MPT programme because it shows how the hybrids perform over multiple different seasons, and across multiple different locations.

To analyse this data, the trials have been separated into three zones:

- Upper North Island includes Waikato and Bay of Plenty
- Lower North Island includes Manawatu and Rangitikei
- South Island

The combined trial analysis was undertaken in a way to avoid an advantage to an entry being in a high yielding trial versus another being in a low yielding trial. The variations from the trial means were then averaged using a weighted average, where more weight is given to trials with higher precision (less variability).

For example, if Trial A had twice the precision of Trial B, the weighted average would be $(2 \times \text{Trial A result} + \text{Trial B result})/3$, and so the result would be closer to the Trial A mean than the Trial B mean.

Data from multiple seasons for a maize hybrids performance is more valuable than results from a single season as they show the hybrids ability to perform over season with different weather patterns. Ultimately, the most consistent performers will rise to the top of multiple year results. The more trials a cultivar has been in, the more confidence can be taken from its reported performance.

GLOSSARY

COEFFICIENT OF VARIATION

The “Coefficient of Variation”, or CV%, is another measure of the variability in a trial. If the differences between cultivars are similar across all replicates, the trial CV% is low (<10%) and the LSD is low (both desirable). If the trial CV% is high (>10%), there is a high level of unexplained variation, and the trial results are less accurate.

LEAST SIGNIFICANT DIFFERENCE

The Least Significant Difference (LSD) listed at the bottom of each table for each column of data should be used to determine if the difference between hybrids is due to differences in performance or random chance.

This booklet presents data with an LSD of 5%. If the difference between two hybrids was equal to or greater than the LSD, the difference would be attributable to hybrid differences in 95% of instances when the two hybrids are evaluated under conditions like those of the test.

Hybrids with the same letter beside them are not significantly different for the characteristic listed. When no significant difference for a given parameter is found among hybrids, “ns” (non-significant) replaces an LSD value. A difference which is less than the LSD is likely due to chance.

For example, on page 22 the hybrids PAC344 (a), PAC314 (ab), P0021 (abc), P9721 (abcd), N39-Q1 (abcde) and Afinity (abcde) all include the letter ‘a’ beside them in the yield column. This indicates that while their yields in this trial varied, this variation was not statistically significant. Likewise, any hybrid with another letter beside it, will not be significantly different from any other hybrid which includes that same letter.

TEST WEIGHT

Measured in kilograms per hectolitre (kg/hl), test weight is an indication of grain density. Test weight is reported at standard grain moisture of 14%.
